

## Why choose EcoOne™ over other products?

[www.EcoOneNorth.com](http://www.EcoOneNorth.com)

It's a common mis-conception that EcoOne™ is just another scum digesting, clarifying, enzyme additive like so many products in the industry. But this is only partially true.

What makes EcoOne™ unique in comparison to Natural Chemistry's Spa Perfect and/or other clarifiers?

EcoOne™ is more than an enzyme-based clarifier. It handles multiple tasks in the spa utilizing a combination of ingredients to meet each problematic area a spa owner might run into.

For example, there are mineral softeners in EcoOne™ that reduce the surface tension of the water. When the surface tension is reduced a reduction of scale formation on the heater element is noted as well as the spas shell.

Reducing the surface tension also leaves the spa water feeling soft, without stripping the calcium/magnesium, which can cause corrosion. This acts as a stain and scale preventer.

EcoOne™ also contains pure organic compounds that act as a flocking agent. These compounds accelerate the rate at which small particles are clumped together and removed from the spa water after use, resulting in crystal clear water. Enzymes break down oils, detergents, etc, but not mineral based contaminants and/or other particulate matter.

There is also a non-foaming surfactant in the product that, in conjunction with our blend of enzymes, works amazingly well at clarifying the water. Enzymes are great on their own, however, when combined with our surfactants become a scum-fighting machine.

Enzymes accelerate interaction between elements, they're catalysts. When used to accelerate the process of other ingredients amazing results can be achieved. This is what we have set out to accomplish with the EcoOne™ system.

Last, but not least. The ingredients in EcoOne™ are housed in a purified coconut extract base. Our customers rave about this added benefit. Not only does the coconut extract leave users skin feeling soft and smooth after use, it also puts a very, very light film on the filter cartridge which increases it's ability to pull contaminants from the water and allows for easy cleaning with a garden hose. This light film will not increase filter load pressure, which could result in a premature failure of the pumps.

All with one simple addition per month!
